

SigMod — Power up your plug-ins

SigMod is a modular plug-in for building custom signal architecture. 13 single-process modules allow routing options that many DAWs do not offer natively.

Combine modules in any order to open up unprecedented routing possibilities. Use the Tap function to set up an aux or FX send midway through the signal chain, not just pre- or post-. Add missing mid/side functionality to any stereo or multi-mono plug-in with the Mid/side module. Host VST and AU plug-ins in a DAW that doesn't support them natively using Insert. Save your ears and speakers from sudden volume jumps with Protect.

SigMod also caters to more basic functionality. Depending on your DAW a simple mono-check, left/right flip or phase invert might not be easily accessible. SigMod has modules for each of these, all in one place.

- Mid/side
- Protect
- Tap
- Crossover
- Insert
- Mute/solo
- Split
- Trim
- Switch
- DC offset
- Mono
- Phase
- Delay
