# INTRODUCING LOUDNESS TOOLKIT 2.8

## New features include:

- Presets for Netflix delivery

- Immersive audio support

- Dialog LRA measurement

- TASA Leq(m) algorithm update

- SAWA Leq(m) algorithm improvement

- Dynapt extension now included in Loudness Toolkit bundle

## Why is this update important?

The updated Loudness Toolkit contains enhanced measurement and display options for Netflix delivery, using both Dialogue and ITU integrated measures simultaneously, and an updated alerts system. *These additions make Loudness Toolkit the only choice for achieving loudness guidelines as detailed in Netflix's best practice document.*

The new version also includes updates to the TASA and SAWA alternatives for Leq(m). With the retirement of the Dolby Media Meter, *VisLM is now the only suggested Leq(m) plug-in for film trailer measurement to the TASA standard.*

Increased channel count allows measurement and correction of 7.1.2 tracks, busses and Dolby Atmos renders.
